Company

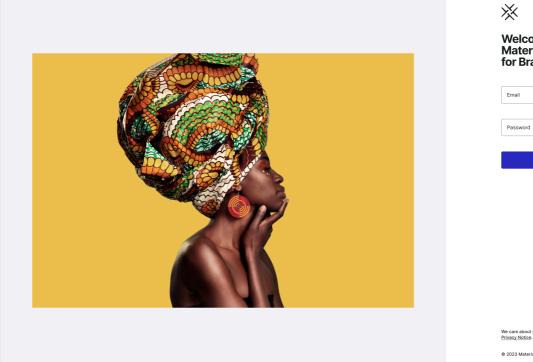

Material Exchange is a VC funded company, developing B2B software products for the fashion industry to make them source efficiently and more sustainable.

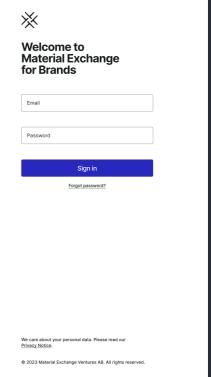

**Outcomes** 

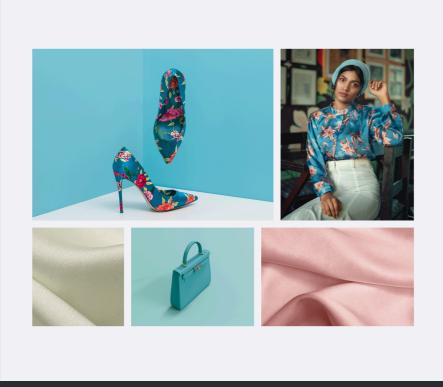

The acquisition of three service agencies meant a business strategy and product change. With agents in the centre acting as a link between suppliers and brands, three products with distinct users were created: Brands, agents and suppliers.

A change in the user journey for unregistered users on brands led to an increase from 0 to 6% of samples being requested.

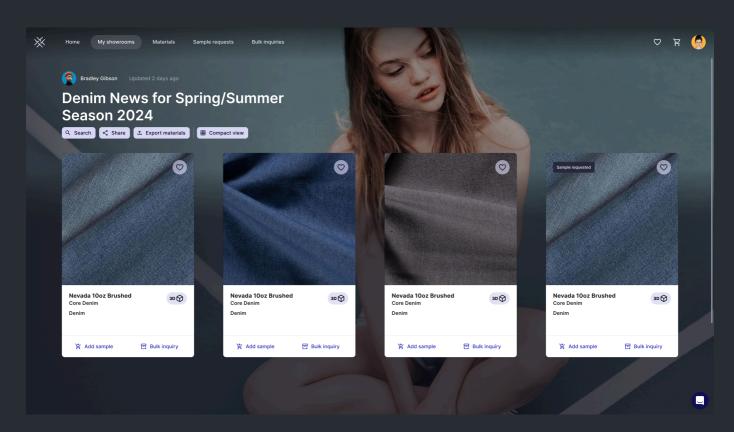

After raising the Series A round, I also lead the development of a new brand identity in collaboration with the marketing team.

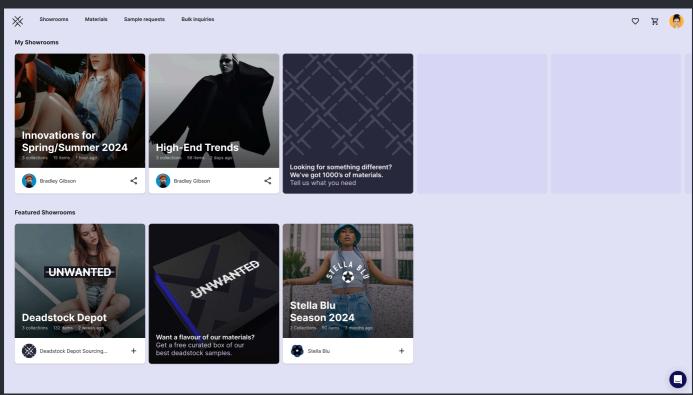

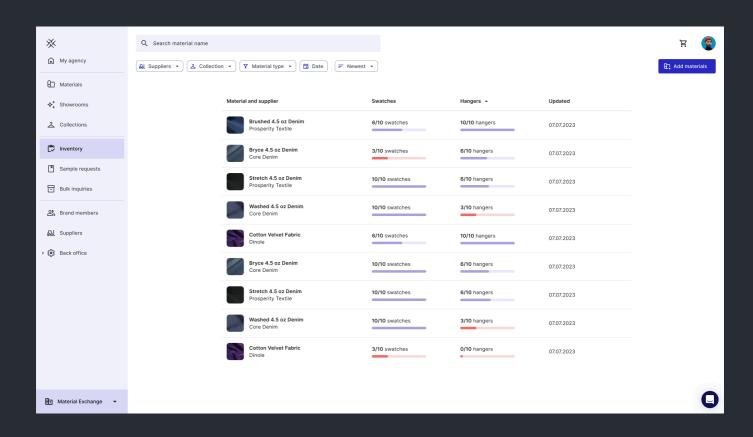

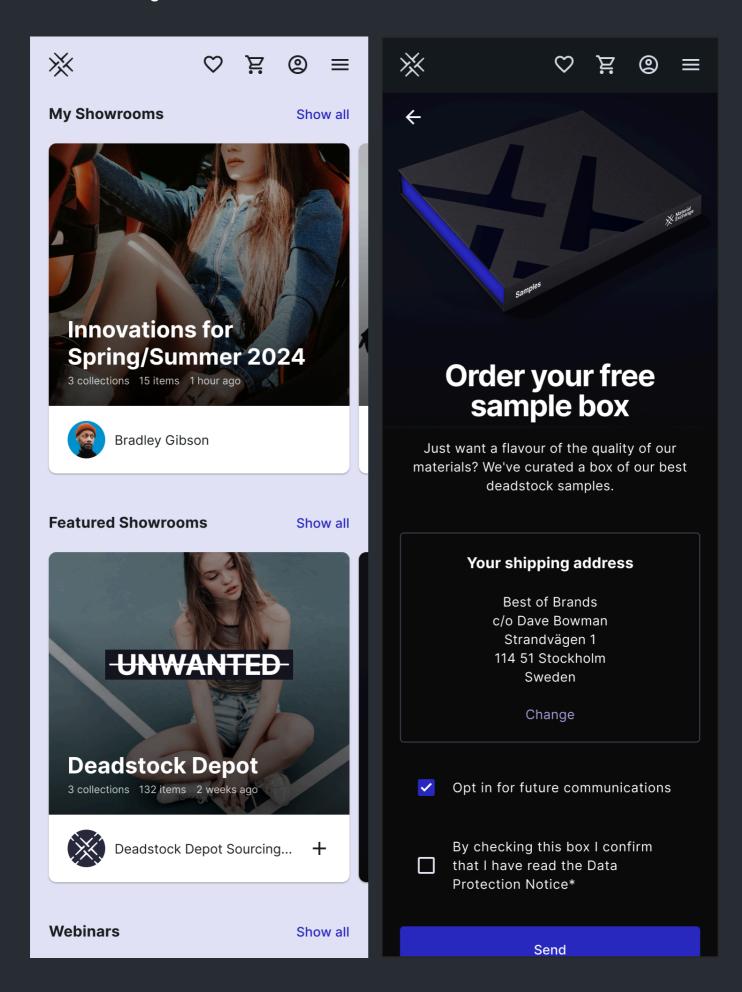

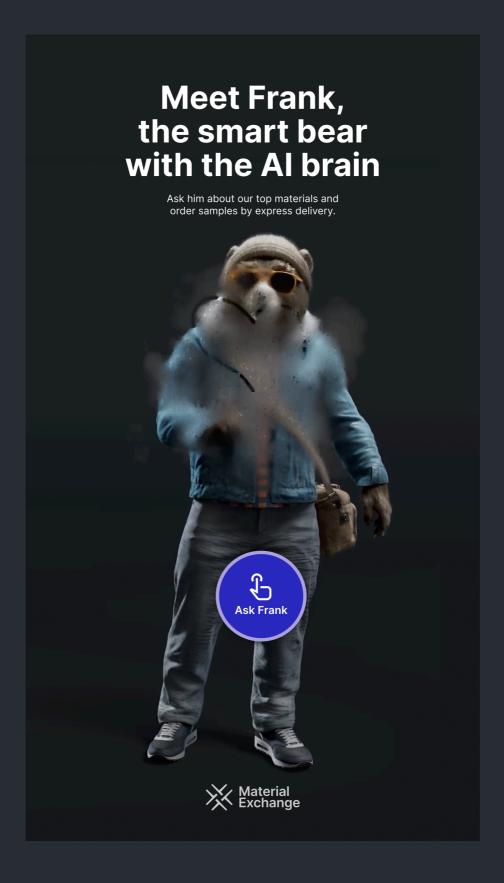

A touch screen TV for our presence at fashion shows featured an animated bear named Frank, drawing attention and make visitors browse available materials digitally.

# Mia Wallace has invited you to the showroom Spring/Summer Collection 2024.

#### Company

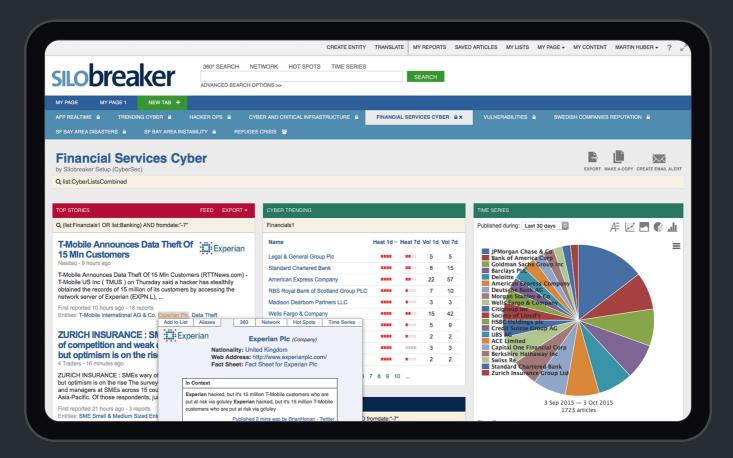

Silobreaker is a SaaS platform designed for cybersecurity professionals to identify and analyse risks within both structured and unstructured datasets. It's primarily used by large corporations across industries like tech, banking, insurance, retail, healthcare, and energy, as well as government organisations. Due to non-disclosure agreements, I'm unable to specify any particular clients.

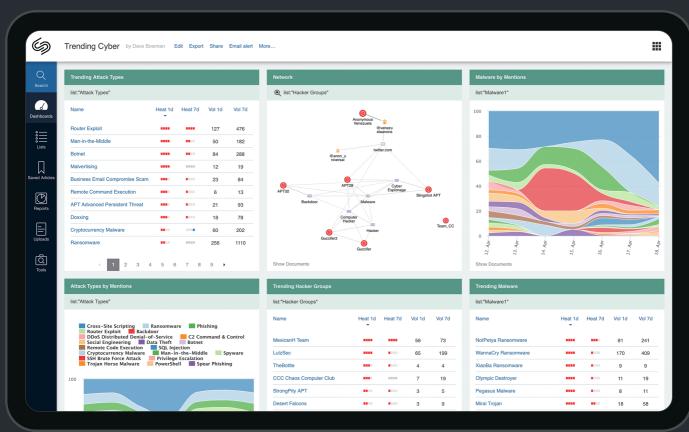

#### **Outcomes**

During my five years at Silobreaker, I led a complete overhaul of the user interface, modernising and preparing it for future growth in an industry often plagued by subpar design. One of the best compliments I received came from a content partner, who said they actually preferred Silobreaker to look at their content over their own platform. The CEO said, the redesign marked a milestone for the company's growth to continue.

I also redesigned a critical internal tool, streamlining it to make it faster and more efficient for analysts to respond to incidents and manage routine tasks.

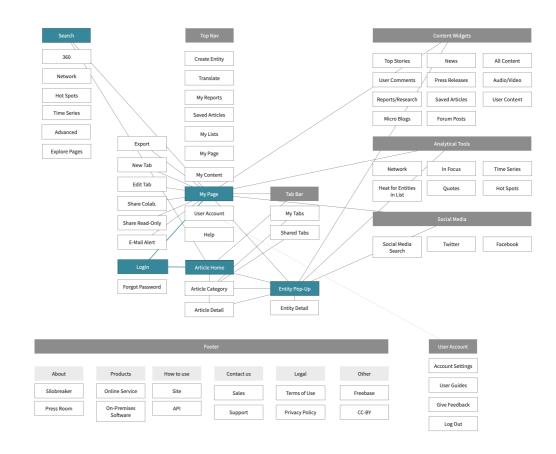

Leveraging my experience in a brand and marketing agency, I helped launch a new brand identity, including a new logo and website. After all, every touchpoint with the customer shapes their overall experience.

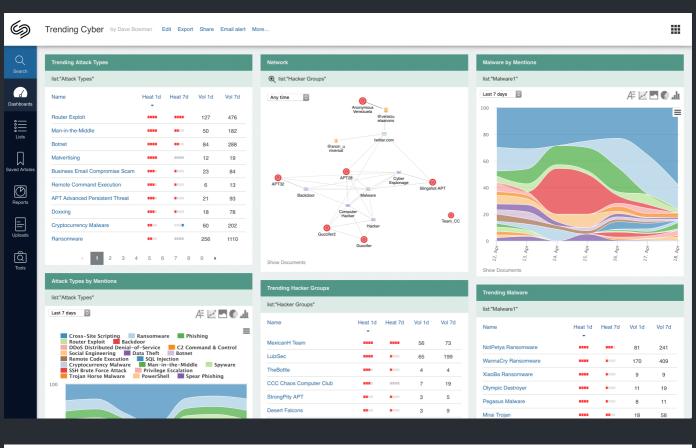

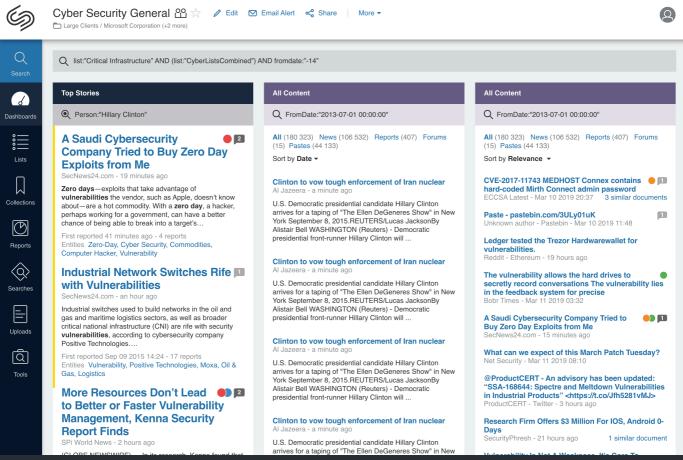

#### Silobreaker Application Map

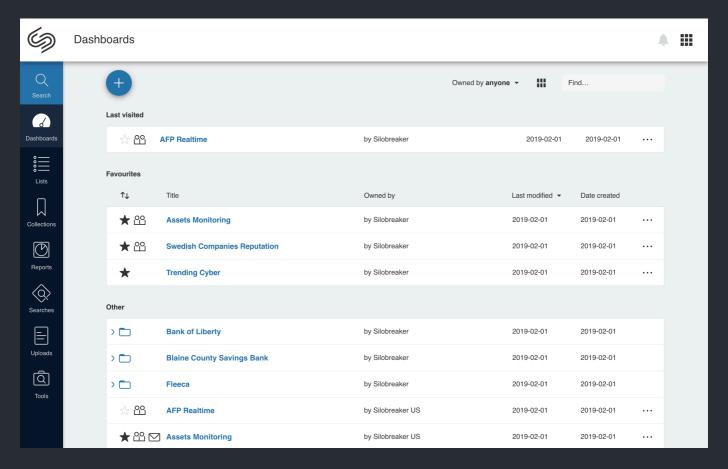

Author Martin Huber Version 1.0 Changed 2015-08-28

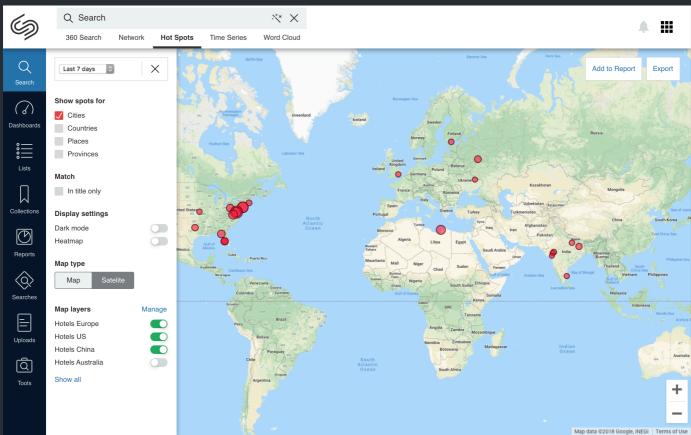

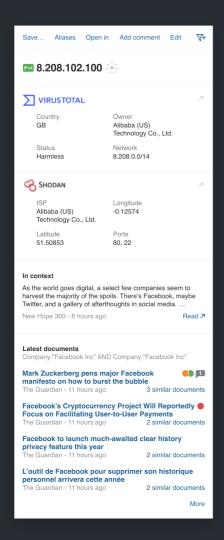

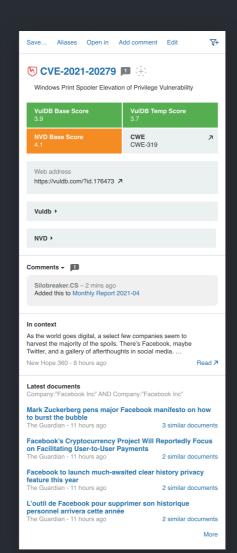

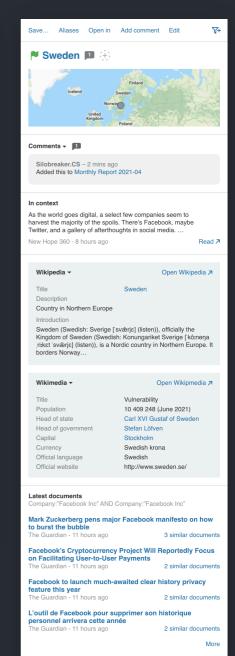

Dashboards are an important concept in the Silobreaker platform. A customer can have multiple Dashboards monitoring different topics, for instance: hacker activity within a certain industry.

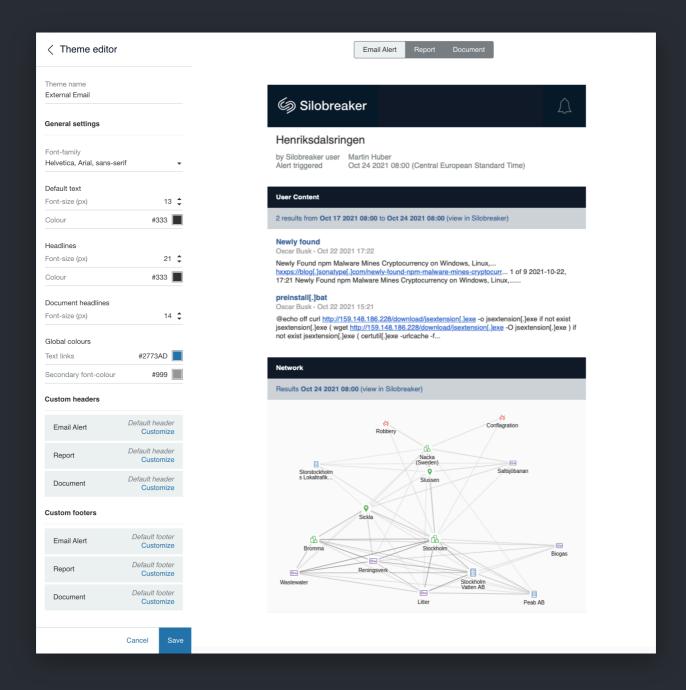

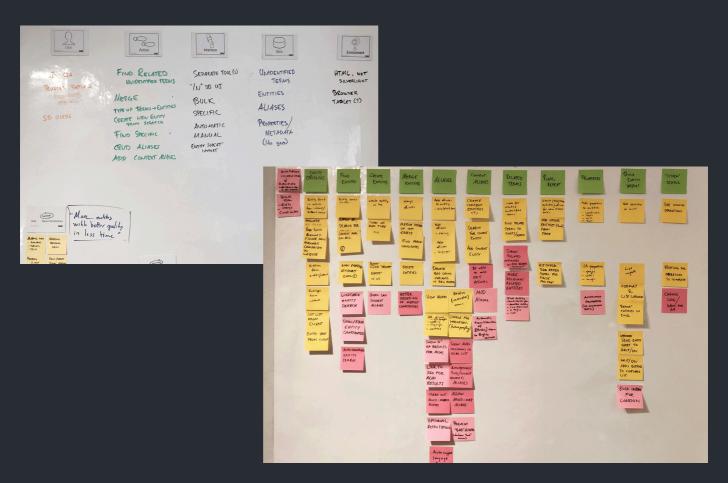

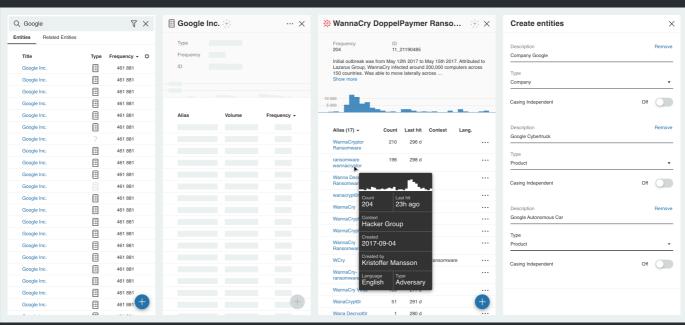

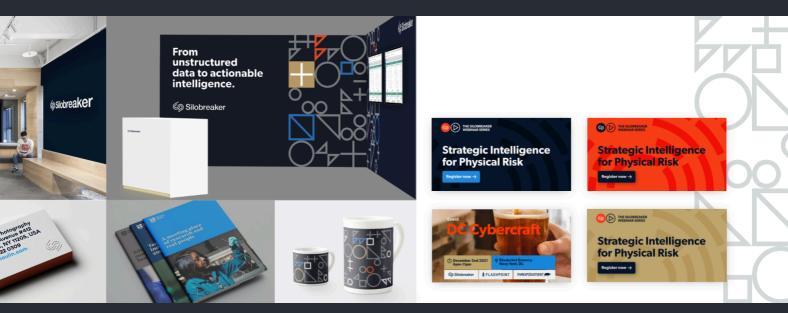

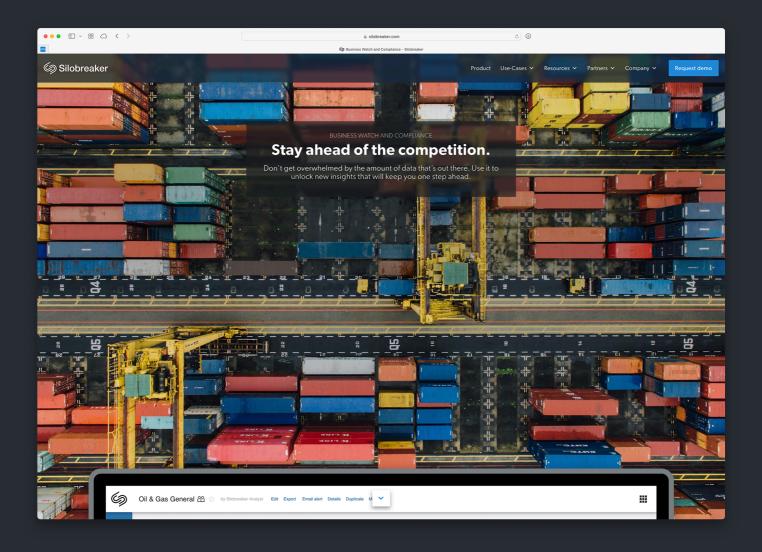

In order to sell the idea of a new corporate identity to the company founders, a style board was created to show the different areas of application. It was accepted and went forward.

As a result of the rebranding, also the corporate website was relaunched, telling the Silobreaker story in a fresh, modern way. (Please note that after a few years, the current website looks different now)

Company

Even after several mergers and acquisitions, bwin continues to be a prominent brand. At its peak, it was the largest gaming operator in sports betting and poker, boasting around 20 million customers, with its headquarters based in Vienna, Austria.

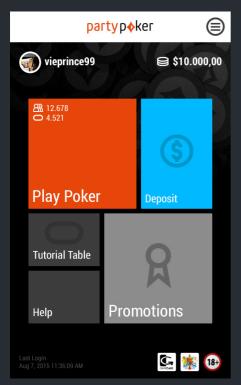

**Brief** 

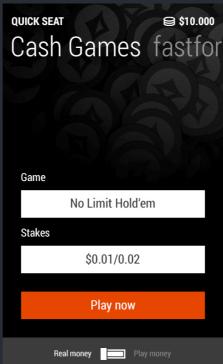

Poker is a game which is easy to learn, but developing an app for it requires deep expertise. The game involves multiple states and intricate microinteractions, which need to be carefully designed to ensure users can process all the information and enjoy the gameplay experience. On a smaller screen, like a smartphone, the challenge is even bigger.

Over the years at bwin, I worked on numerous product features. My final project was leading the design of a new poker app for Windows Phone, where I worked closely with two other designers to bring the vision to life.

**Outcomes** 

At the time, most poker apps were simply ports of desktop versions, carrying over their traditional interaction designs. Our approach was different. We aimed to innovate by taking full advantage of touchscreen capabilities. We focused on creating natural, intuitive gestures and touch interactions that felt seamless and native to mobile devices.

**EntryScape** 

Services Product design Design system Prototyping Desktop

Client

EntryScape is a web-based digital application of MetaSolution, which provides services to authorities, governmental organisations or companies to publish their open data. It is used by high profile organisations such as Skatteverket, Polisen, Försäkringskassan and many more in Sweden but it is also used in other European countries.

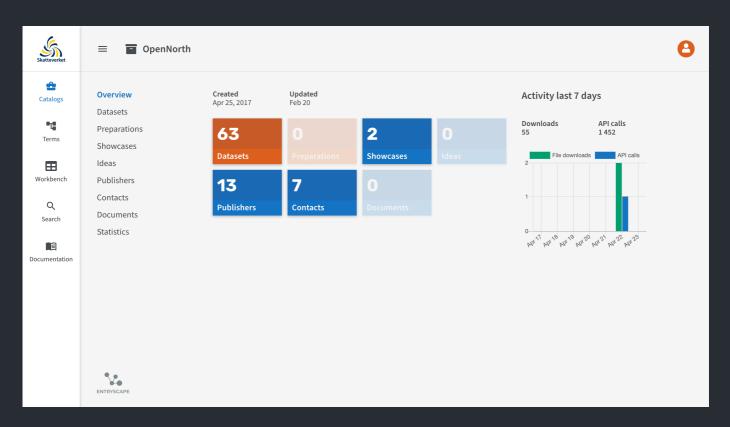

**Brief** 

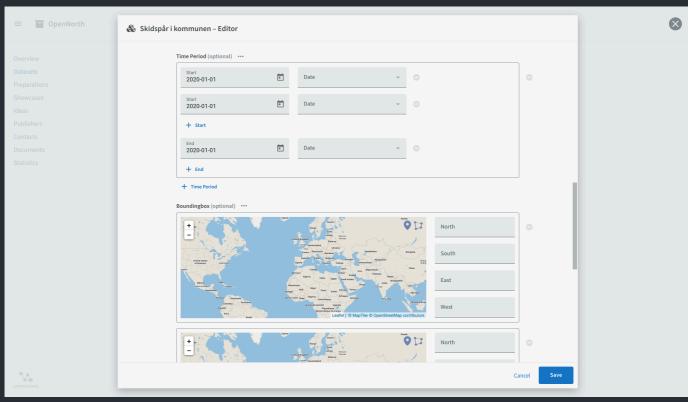

Provide a design system and library of components which developers can use to ensure consistency across different product services. Optimise layouts and simplify user flows to increase productivity and make a complex product easier to understand and more intuitive and fun to use by providing a better user interface design.

**Outcomes** 

The redesign was met with positive feedback received from customers and the design library is still in use today to develop new features with minimal design input.
